

Install Visual Studio Code

1. First check to see if you have Visual Studio Code.
2. Open your App search or click your search bar and type “Visual Studio Code”. If nothing pops up then you will need to follow the install instructions, but if an app does pop up then you do not need to follow the instructions in this PDF, unless you are looking to update your app to the current version.
3. Please click this link which will take you to the Visual Studio Code download page: [Download Visual Studio Code - Mac, Linux, Windows](#). Once you arrive, please click the download button that works best for your OS, and shortly after your download should start.
4. After your package is fully installed, please click it to open the install windowpane. Keep clicking next until you reach the install button. Your installer pane may look different to this picture.

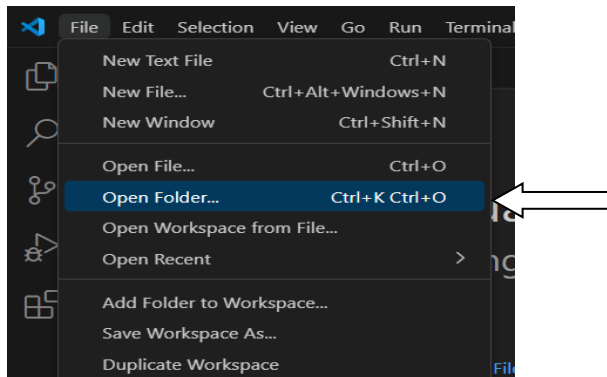

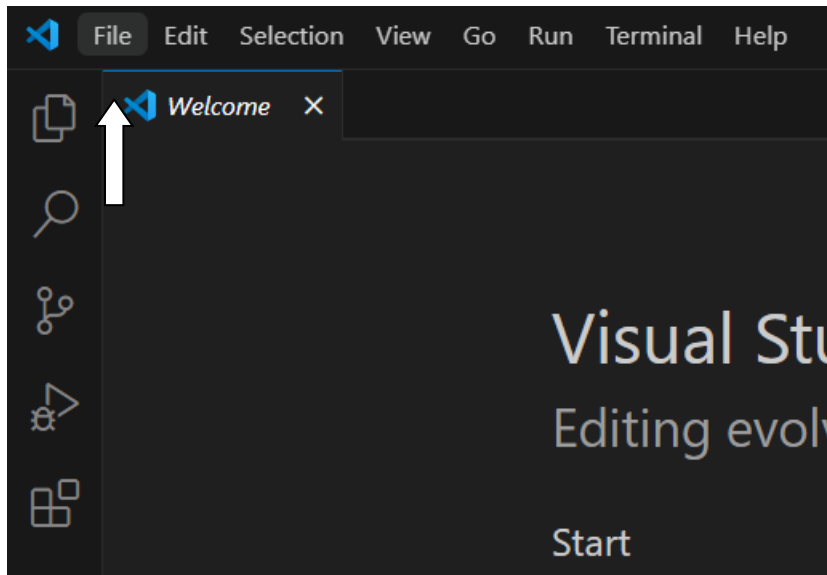

5. Visual Studio Code should start the installation process automatically. As it is downloading, please do not exit or cancel the download process as it may cause trouble later.
6. After the app is finished downloading you may be prompted to install some extensions. For this workshop you will not need to install any extra extensions, but you may choose to download some for future usage.
7. If you have not opened the app already, please do so now by searching for it and clicking on the app.

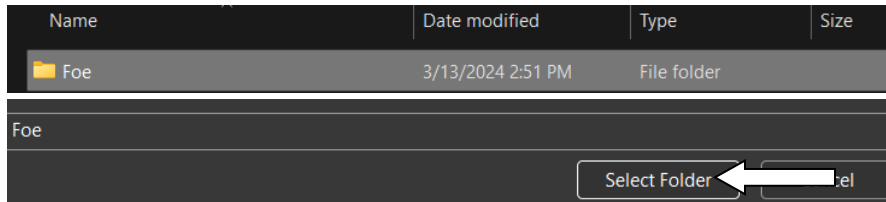

8. Next, we need to open our recently downloaded Foe's folder. To do so click on "Open Folder" under the Star options listed on the Welcome page.

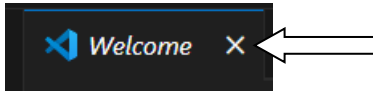

9. If you do not see the Welcome page, click File at the top left of your page and scroll till you see "Open Folder" and then click that.

10. Your file explorer will open, and you will need to find where you downloaded the Foes folder in your files. Select it then click “Select Folder”.

11. Visual Studio Code will now open the folder in a coding space. If the welcome page is still there when you open your folder just hit the “X” button to close it as you won’t need it again.

12. Click around to see the contents of the Foes folder. It is important to know that files that are PDF are not able to be viewed in Visual Studio Code so you will have to open your file explorer and open the PDFs manually to see them or go on GitHub to the Foes Document Folder.
